

## Used Parts for Forklifts

Used Forklift Parts - Without doubt, lift truck components would eventually wear out and require replacing. The choice of obtaining brand new parts could become expensive so one more idea is to buy used parts. This can save a lot of cash eventually. It is a great idea to obtain used forklift components which have been reproduced. These components will ensure that you are getting components which will work for a long time and be productive.

Broken or worn parts which are reproduced are a very cost effective solution as opposed to rebuilding. With rebuilding parts, just the components that are broken or worn out get changed, which means that other wearable components can break down soon after acquisition.

Remanufacturing on the other hand offers the best assurance for second-hand components. Remanufactured components are taken apart and cleaned and then all wearable pieces are changed. All wearable components are replaced regardless of age or wear which is another rationale why remanufactured components overall run so much better. Whichever part within the part is new and this provides much longer life to the second-hand part. Depending on the forklift components which are being redone, the cleaning process and the entire remanufacturing process would vary.

The engines are cleaned after a complete disassembly. Different engine parts like for example spark plugs, pistons, rings, valves, valve springs, and filters can be replaced during the process of remanufacturing. The engines are hot tested after reassembly to ensure that there are no oil pressure problems, no leaks, noises or any vacuum.

Transmissions are pressure washed, disassembled and oven cleaned. A comprehensive inspection is done in order to check for any cracks. Bushings, seals and bearings are all replaced. Normally, the replacement components used on transmission components meet OEM specifications.

A few components like for instance the water pump, torque converters, the alternator, steer axles and the starter can acquire longer serviceability after being reproduced and having all wearable parts replaced. The electronic control in the electric forklift is maintained by the control card. This particular card can even be remanufactured with replacing all aged and worn out parts. Not like various lift truck components the control card could only have the worn and aged parts replaced.

Remanufactured components are thoroughly checked upon reassembly to guarantee they are in top condition prior to being sold. It is essential when obtaining reproduced parts to make sure they have undergone the proper testing and inspection procedures. On certain bigger parts like for example engines, transmissions and steer axles, OEM specification replacement parts should be used.

The lift truck dealer can guarantee that the parts they have reproduced meet the OEM specifications. This would also ensure the parts meet industry standards. Lots of details go into remanufacturing used components. This attention to detail provides more serviceability out of remanufactured parts opposed to the parts that were just rebuilt.
